

# GRIB API – advanced tools

## Computer User Training Course 2015

**Paul Dando**

**User Support**

**[advisory@ecmwf.int](mailto:advisory@ecmwf.int)**

# Overview

- [grib\\_filter](#)
  - Introduction
  - Rules syntax
  - Examples
  - Practical
- [grib\\_to\\_netcdf](#)
  - Usage
  - Examples
  - Practical

# grib\_filter – introduction

- GRIB API advanced command-line tool
- Iterates over all the messages in the input
- Applies a set of user defined rules to each message
- The rules are formed using a macro language GRIB API provides
- Note that the macro language does not have the capabilities of a full-blown programming language

# grib\_filter – introduction

- Access data inside a message through keys
- Print contents of a message
- Set values inside a message
- Use control structures (**if**, **switch**)
- Write a message to disk

# grib\_filter – usage

```
grib_filter [-o out_file] rules_file in_file1 in_file2 ...
```

- Each field from the input files is processed and the rules contained in the `rules_file` are applied to it
- A GRIB message is written to an output file only if a write instruction is applied to it
- Each instruction in the `rules_file` must end with a semicolon “;”
- Syntax errors in the `rules_file` are reported with their line number
  
- Always put `-o out_file` before the other options !

# Rules syntax – print statement

- `print "some text"; # this is a comment`
- `print "some text [key]";`
  - Print to the standard output.
  - Retrieve the value of the keys in squared brackets.
  - If a key is not found in the message then the value of `[key]` will be displayed as "undef".
  - `[key]` -> native type
  - `[key:l]` -> integer (the "el" is for "long"!) - or use `[key:i]`
  - `[key:s]` -> string
  - `[key:d]` -> double
  - `[key!c%F'S']` -> arrays: c->columns F->format (C style) S->separator
- `print ("filename") "some text [key]";`

## Example 1 – using print

```
# A simple print  
print "ed = [edition] centre is [centre:s] = [centre:i]";
```

```
> grib_filter rule.filter x.grib1
```

```
ed = 1 centre is ecmf = 98
```

## Example 2 – formatted print

```
# one column 3 decimal digits  
print "[distinctLatitudes!1%.3f]";
```

```
> grib_filter rule.filter x.grib1
```

```
-90.000
```

```
-88.500
```

```
-87.000
```

```
-85.500
```

```
...
```

## Example 3 – print with separator

```
# three columns 5 decimal digits comma separated  
print "[latLonValues!3%.5f',']";
```

```
> grib_filter rule.filter x.grib1  
90.00000,0.00000,1.00000,  
90.00000,1.50000,1.00000,  
90.00000,3.00000,1.00000,  
...
```

# Rules syntax – write statement

- `write;`

- Writes the current message to the output file defined in the command line with the option `-o` ( `grib_filter -o outfile rules_file grib_file`)
- If the `-o` option is not specified, the default value “`filter.out`” is used

- `write "filename_[key]";`

- Writes the current message to the file “`filename_[key]`” where the key in square brackets is replaced with its value retrieved from the message
- If two messages have different values for `[key]` they are also written to different files

## Example 4 – write statement

```
# Creating multiple files  
write "[centre]_[dataDate]_[step].grib[edition]";
```

```
> grib_filter rule.filter x.grib1
```

```
> ls
```

```
ecmf_20080213_0.grib1
```

```
ecmf_20080213_6.grib1
```

```
ecmf_20080213_12.grib1
```

```
ecmf_20080213_24.grib1
```

# Rules syntax – append statement

- **append ;**

- Appends the current message to the output file defined in the command line with the option `-o` (`grib_filter -o outfile rules_file grib_file`).
- If the `-o` option is not specified, the default value “`filter.out`” is used

- **append “filename\_*[key]*” ;**

- Appends the current message to the file “`filename_[key]`” where the key in square brackets is replaced with its value retrieved from the message
- The file is created if it does not exist
- If two messages have different values for *[key]* they are appended to different files

## Example 5 – append statement

```
append;
```

```
> grib_count out.grib
```

```
> 1
```

```
>
```

```
> grib_filter -o out.grib rule.filter in.grib
```

```
>
```

```
> grib_count out.grib
```

```
> 2
```

# Rules syntax – setting keys

- `set key1 = key2 ;` # set key1 to the value of key2
- `set key = {val1, val2, val3, val4} ;` # set an array key
- `set key = "string" ;` # set key to a string
- `set key = expression ;` # set key to an expression
- `set key = MISSING ;` # set value of key to missing
- expression operators :
  - `==` equal to
  - `!=` not equal to
  - `is` equals to for strings
  - `||` or
  - `&&` and
  - `!` not
  - `* / + -` arithmetic operators
  - `( )`

## Example 6 – setting a key

```
set edition = 2;  
write "[file][edition]";
```

```
> grib_filter rule.filter x.grib
```

```
> ls
```

```
x.grib
```

```
x.grib2
```

## Example 7 – setting an array key

```
set values = {12.2,14.8,13.7,72.3};  
print "values = { [values] }";  
write "[file].[edition]";
```

```
> grib_filter rule.filter x.grib  
values = { 12.2 14.8 13.7 72.3 }
```

# Rules syntax – transient keys

- **transient key1 = key2;**
  - Defines the new key1 and assigns to it the value of key2
- **transient key1 = "string";**
- **transient key1 = expression ;**
- expression operators:

<b>==</b>	equal to
<b>!=</b>	not equal to
<b>is</b>	equals to for strings
<b>  </b>	or
<b>&amp;&amp;</b>	and
<b>!</b>	not
<b>* / + -</b>	arithmetic operators
<b>( )</b>	

## Example 8 – transient keys

```
transient mystep = step + 24;  
print "step = [step] mystep = [mystep]";
```

```
> grib_filter rule.filter x.grib  
step = 24 mystep = 48
```

# Practicals

- To get the material for these practicals:

```
cd $SCRATCH/grib_tools/grib_filter
```

- Run `grib_filter` with the rules files ‘`print.filter`’, ‘`write.filter`’, ‘`transient.filter`’ on ‘`tigge.grib`’.
- Comment/uncomment the instructions one by one to see the different behaviours.

**Reminder:** If you need to get the material for the practicals:

- Make a copy of the practicals directory in your \$SCRATCH

```
tar -xvf /home/ectrain/trx/grib_api/grib_tools.tar
```

- This will create a directory in your \$SCRATCH containing the GRIB data files for all the practicals

# Rules syntax – if statement

- `if ( expression ) { instructions }`
- `if ( expression ) { instructions }`  
`else { instructions }`

- Expression operators:

<code>==</code>	equal to
<code>!=</code>	not equal to
<code>is</code>	equals to for strings
<code>  </code>	or
<code>&amp;&amp;</code>	and
<code>!</code>	not
<code>* / + -</code>	arithmetic operators
<code>( )</code>	

*There is no 'else if'  
- you have to  
create a new block*

## Example 9 – if statement

```
if (localDefinitionNumber == 1) {  
    set edition = 2;  
    write;  
}
```

```
> grib_filter -o out.grib2 rule.filter x.grib1  
> ls  
out.grib2
```

# Rules syntax – switch statement

- Alternate version of an ‘if-else’ statement
- More convenient to use when you have code that needs to choose a path from many to follow

```
switch (var) {  
    case val1:  
        # set of actions  
        ...  
    case val2:  
        # set of actions  
        ...  
    default:  
        # default block of actions  
}
```

*default:  
case is  
mandatory  
even if  
empty*

## Example 10 – switch statement

```
print "processing [paramId] [shortName] [stepType]";
switch (shortName) {
    case "tp" :
        set stepType="accum";
    case "sp" :
        set typeOfLevel="surface";
    default:
        print "Unexpected parameter";
}
write;
```

# Example 11

```
if (centre is "lfpw" &&
    (indicatorOfParameter == 6 ||
     indicatorOfParameter == 11 ||
     indicatorOfParameter == 8) )
{
  if (step!=0) {
    set typeOfGeneratingProcess=0;
    set typeOfProcessedData=0;
  } else {
    # Other steps
    set typeOfProcessedData=1;
  }
  ...
}
```

```
...
switch (typeOfLevel) {
  case "hybrid":
    set changeDecimalPrecision=1;
  case "surface":
    set changeDecimalPrecision=2;
  case "isobaricInhPa":
    if (level > 300) {
      print "level > 300";
      set level = level*2 + 15;
    } # end if (level > 300)
  default:
    print "Unknown level type!";
} # end switch (typeOfLevel)
} # end if (step!=0)
write;
} # end main if
```

# Rules syntax – assert statement

- `assert (condition) ;`
- If the condition evaluates to false then the filter will abort

```
# This filter should be run on GRIB edition 1 only;  
# abort otherwise  
  
assert (edition == 1) ;  
  
...
```

```
> grib_filter -o out.grib2 rule.filter x.grib2  
GRIB_API ERROR      : Assertion failure:  
binop(access('edition=2'),long(2))  
ERROR: Unknown error -13
```

## `grib_to_netcdf` – convert to netCDF

- Use `grib_to_netcdf` to convert GRIB messages to netCDF
- Input GRIB fields must be on a regular grid
  - `gridType=regular_ll` or `gridType=regular_gg`
- Options allow user to specify the netCDF data type:
  - `NC_BYTE`, `NC_SHORT`, `NC_INT`, `NC_FLOAT` or `NC_DOUBLE`
  - `NC_SHORT` is the default
- Options allow the user to specify the reference date
  - Default is 19000101
- Used in the MARS web interface and the public Data Servers to provide data in netCDF

# grib\_to\_netcdf – usage

```
grib_to_netcdf [options] grib_file grib_file ...
```

- Options

- o `output_file` Output netCDF file
- R `YYYYMMDD` Use `YYYYMMDD` as reference date
- D `NC_DATATYPE` netCDF data type
- I `key1, key2, ...` Ignore keys.  
Default: `method, type, stream, refdate, hdate`
- S `key1, key2, ...` Split according to keys. Default: `param, expver`
- T Do not use time of validity.
- u `dimension` Set `dimension` to be an unlimited dimension
- f Do *not* fail on error
- ...

## grib\_to\_netcdf – examples

- To convert the fields in file.grib1 to netCDF

```
> grib_to_netcdf -o out.nc file.grib1
grib_to_netcdf: Version 1.13.0
grib_to_netcdf: Processing input file 'file.grib1'.
grib_to_netcdf: Found 1 GRIB fields in 1 file.
grib_to_netcdf: Ignoring key(s): method, type, stream,
    refdate, hdate
grib_to_netcdf: Creating netcdf file 'out.nc'
grib_to_netcdf: NetCDF library version: "3.6.3" of Jul  2
    2014 12:12:00 $
grib_to_netcdf: Defining variable 't'.
grib_to_netcdf: Done.

> ls -s out.nc
132 out.nc
```

## grib\_to\_netcdf – examples

- To convert the fields in file.grib1 to netCDF with data type set to `NC_FLOAT`

```
> grib_to_netcdf -D NC_FLOAT -o out.nc file.grib1
grib_to_netcdf: Version 1.13.0
grib_to_netcdf: Processing input file 'file.grib1'.
grib_to_netcdf: Found 1 GRIB fields in 1 file.
grib_to_netcdf: Ignoring key(s): method, type, stream,
    refdate, hdate
grib_to_netcdf: Creating netcdf file 'out.nc'
grib_to_netcdf: NetCDF library version: "3.6.3" of Jul  2
    2014 12:12:00 $
grib_to_netcdf: Defining variable 't'.
grib_to_netcdf: Done.
```

```
> ls -s out.nc
```

```
260 out.nc
```

*Output netCDF file is about twice the size*

# Practical – grib\_to\_netcdf

1. Use `grib_to_netcdf` to convert the GRIB messages in `file1.grib` to netCDF
  - Try with both the default data type (`NC_SHORT`) and `NC_FLOAT`
  - Check the data values in each case with `ncdump`
2. Repeat but set the reference date to 25 February 2015
  - Check the output with `ncdump` and compare with the previous exercise
3. Use `grib_to_netcdf` to convert the GRIB messages in `file2.grib` to netCDF
  - What happens ... and why ?
